This sequence represents a probe for the coding sequence for the alpha epithelial sodium channel a (alphaENACa). AlphaENACa (see W34529) and alphaENACb (see W34530) represent the sequences of the invention. The two sodium channels are alternatively spliced forms of the invention. The two amiloride-sensitive salt channel alpha subunit and can be used in membrane-transport or binding assays to identify substances that enhance or block perception of a salty taste. Enhancers could be used as salt substitutes and blockers could be used to mask salty tastes in foods and pharmaceuticals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a probe for the coding sequence for the alpha epithelial sodium channel a (alphaENACa). AlphaENACa (see W34529) and alphaENACb (see W34529) represent the sequences of the invention. The two sodium channels are alternatively spliced forms of the mainloride-sensitive salt channel alpha subbinit and can be used in membrane-transport or binding assays to identify substances that enhance or block perception of a salty taste. Enhancers could be used as salt substitutes and blockers could be used to mask salty tastes in foods and bearmaceuticals.
                                                                                                                                                                                     T2 DNA-polymerase

This sequence represents the coding sequence for the alpha epithelial
Sodium channel a (alphaENACa). AlphaENACa and alphaENACD (see W34530)
represent the sequences of the invention. The two sodium channels are
alternatively spliced forms of the aniloride-sensitive salt channel alpha
subunit and can be used in membrane-transport or blnding assays to
identify substances that enhance or block perception of a salty taste.
Enhancers could be used as salt substitutes and blockers could be used to
mask salty tastes in foods and pharmaceuticals.
Sequence 75 BP; 11 A; 22 C; 22 G; 20 T;
P-PSDB; W34529.
Alternatively spliced epithelial sodium channel alpha subunit
proteins – useful in screening assays for salty taste enhancers or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 75;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   initiation codon are integrated Disclosure; Fig 1; 15pp; Japanese. Also new are bacteria (E. coil) expressing HP which contain it and the prodon of HP by their culture. A promoter, Shine-Dalgarno (SD) sequence and translation initiation codon (TIC) are inserted, in order, upstream of the HP gene. The HP gene is isolated from pLP100, the promoter; SD sequence and TIC are obtd. from pDR720, and these are ligated with a synthetic DNA linker to produce plasmid pTP100. It allows large amts. of HP to be produced recombinantly. Sequence 960 BP; 287 A; 246 C; 209 G; 218 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1577
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 90-047987/

Plasmid for amplification of the human prolactin gene
from human pituitary tissue and cultivated in ampicillin medium to obtain a pBR 322 ampicillin resistant gene. Disclosure; Table 1-9; 9pp; Japanese. Sequence is derived from human pituitary gland tissue, ar pre-prolactin to be produced by a circular plasmid carry;
                                                                                                                                                                                                                                                                  an ampicillin containing medium.                                                                                                                                                                                                                                                                                                                                                                                                               Plasmid for amplification of human growth hormone gene - derived from human pituitary gland tissue.

Disclosure; Table 1-9; Ppp; Japanese.

Sequence is derived from human pituitary gland tissue, and allows pro-growth hormone to be produced by a circular plasmid carrying amp resistance gene, from a transformed E.coli expression system:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes the human disease associated protein tyrosine phosphatase protein, designated HPTP-1, of the invention. HPTP-1 and HPTP-2 are associated with inflammatory cells and various cancers. They can be used to develop products for treating inflammatory conditions such as rheumatoid arthritis and osteoarthritis and carcinomas of the intestine, bladder, prostate, breast and brain. The products can also be used for detection, diagnosis and drug screening.

                                                                                                                                                                                                pilosula ant venom, used for reducing blood pressure in animals or for inhibiting cell growth

Claim 1; Fig 1; 27pp; English.

This sequence is an isolated cDNA clone, designated Myr p2, which includes a sequence encoding a polypeptide that has the biological activity of pilosulin 2 having the amino acid sequence from residues 49-75 of a 75-amino acid sequence (W21784). It was isolated from a cDNA library prepared from the abdomens of Myrmecia pilosula ants by immunoscreening with sera from venom-allergic individuals. The isolated sequence can be incorporated into an expression vector and used to produce pilosulin 2 in transformed host cells. Pilosulin 2 and its analogues or fragments can be used in claimed methods for reducing the blood pressure of an animal, and for inhibiting the growth of (Killing) cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Proceeding the nucleotide sequence of nfspyl-606, which encodes a Claim 1; Page 142-143; 172pp; English.

This is the nucleotide sequence of nfspyl-606, which encodes a Claimed full-length flea saliva protein, termed pfspyl-113 (see W82386). nfspyl-606 was isolated from a whole flea cDNA library using partial clone nfspyl-420 (see W73419) as probe. It s nucleotide sequence shows no significant homology to known sequences. Mature fspyl protein (see W82387), and a nucleic acid sequence encoding it (see W73443) are also claimed. The invention is directed to methods for isolating ectoparasite saliva proteins (ESPs). It provides ESPs (claimed, see W82382-93), nucleic acid molecules encoding them, methods for their recombinant production, therapeutic compositions for treating allergic dermatitis, and a method of desensitising a host animal to allergic dermatitis, and a method of desensitising a host animal to allergic dermatitis using ESPs. The ESPs can also be used for the production of antibodies useful a library dermatitis using ESPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      claimed full-length flea saliva protein, termed PfspJ1-113 (see W82386). nfspJ1-606 was isolated from a whole flea cDNA library using partial clone nfspJ-200 (see V73419) as probe. Its nucleotide sequence shows no significant homology to known sequences. Mature fspJ1 protein (see W83387), and a nucleic acid sequence encoding it (see V73443) are also claimed. The invention is directed to methods for isolating ectoparasite saliva proteins (ESPS). It provides ESPs (claimed, see W82387-93), nucleic acid molecules encoding them, methods for their recombinant production, therapeutic compositions for treating allergic dermatitis that comprise at least one ESP, as well as assay kits for testing if an animal has, or is susceptible to, allergic dermatitis, and a method of desensitising a host animal to allergic dermatitis using ESPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence encodes a novel human endothelial differentiation gene (EDG)-6 receptor homologue designated HEDG. The encoded protein can be used for detection, diagnosis and drug screening. The protein can also be used to treat inflammation or diseases including viral, bacterial, or fungal infections, allergic responses, mechanical injury associated with trauma, hereditary diseases, lymphoma or carcinoma, or other conditions which activate the genes of lymphoid or neuronal tissues. It can also be used for treating problems involving excessive lymphocyte and leukocyte trafficking. Inhibitors of HEDG are useful for controlling signal transduction and signalling cascades in cells of the rheumatoid synovium. The protein can also be used for treating autoimmune disorders such as mysterbadia cravia.
                                                                                                                 used in enzyme replacement therapy for Schindler disease Disclosure; Fig 2 (A-D); 71pp; English.

The sequence is of the pAGB-3 cDNA insert contg. the complete coding region for human alpha-GalNAc.

The availability of the full length cDNA for alpha-GalNAc allows the study of the genomic organisation and evolution of this lysosomal gene, and the characterisation of molecular lesions causing Schindler disease.

The invention provides a CDNA sequence contained in the plasmid pSSU.NP1 cencoding the small subunit of ALS (ssuALS). The plasmid vector comprising the ssuALS nucleotide operably linked to a regulatory sequence can be used to transform host cells for the recombinant production of the ssuALS protein which is used for evaluating a compound for acetolactate synthase can be compound for acetolactate synthase (ALS) inhibition comprises expression and purification of plant ssuALS from the transformed host, mixing this suals. With the large subunit of ALS to form a holoenzyme which is then treated with a test compound. Treated and untreated holoenzyme activity are compared to select compounds with potential for herbicidal activity. Previously, large subunits of plant ALS (lsuALS) have been isolated, but the existence of ssuALS had not been verified. Mixing the two subunits results in a holoenzyme that has a 4-15 fold increase in specific activity over lsuALS alone.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. neurological disorders, tumours, immune disorders, inflammation or haematological disorders (Laim 1; Page 172; 215pp; English.

X51701-55 encode human secreted proteins. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each polynucleotide, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, immune disorders, infection, inflammatory disorders, skin disorders, tumours, atherosclerosis, restenosis, autoimmune disorders, Alzheimer's disease, peripheral neuropathies, steletal disorders, neurological disorders, arthritic disorders, asthma, immunodeficiency diseases, Alzheimer's arthritic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

Claim 1; Page 414; 618pp; English.

The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make

                                                                                                                                                                                                                                                         Claim 18; Page 38; 56pp; English.

The mCP10 cDNA was derived from a Sepharose-Concanavalin A-activated spleen cell library prepd. using cells from A/J mice. CP-10 has an apparent mol. wt. of ca. 10 kD and is chemotactic for neutrophils, monocytes/macrophages and/or other mammalian cells. CP-10 is useful (e.g. when admin. locally around a tumour or site of infection) to attract neutrophils etc., esp. in immunocompromised patients or patients allergic to skin test antigens. Antibodies to CP-10 are useful for control of inflammation and/or tissue damage associated with inflammation, (e.g. due to autoimmune disease or delayed hypersensitivity), cystic fibrosis or emphysema. Ab can also be used purify CP-10 and in diagnosis.

CC secreted proteins. The polynucleotide and amino acid sequences are useful CC for preventing, treating or ameliorating medical conditions e.g. by CC protein or gene therapy. Pathological conditions can be also diagnosed by CC determining the amount of the new polypeptides in a sample or by the CC determining the amount of the new polypeptides. The nucleic acid consequences, or its fragments, are useful for chromosome identification and CC mapping; as antisense and triplex-forming therapeutics; in gene therapy; CC for (forensic) identification of individuals; as molecular weight CC markers; to identify related sequences or specific mRNA; in preparation CC of oligomers and to raise anti-DNA antibodies. Antibodies are useful as immunoassay reagents (including for in vivo imaging) and therapeutically CC to inhibit or activate particular polypeptides. A very wide range of CC disorders may be treated with the polynucleotide and polypeptide conferences, e.g. autoimmune or haematological diseases, allergy.

C1 infections The scennences may also be inseful in wound healing to other infections. The scennences may also be inseful in wound healing to

                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acid sequences (X22211 to X22282) encoding human secreted proteins (Y01383 to Y01454). The secreted protein gene sequences are deposited with the ATCC under deposit number ATCC 209138, 209139 or 209141. Host cells containing vectors comprising the nucleic acid sequences are used for the recombinant expression of the
infections. The sequences may also be useful in wound healing, to modulate differentiation of embryonic stem cells, to modulate weight, appetite, behaviour etc. and as food additive or preservative. The present sequence represents a gene encoding a human secreted protein (see descriptor line for gene number and clone identification). Sequence 437 BP; 136 A; 128 C; 97 G; 72 T;

disorders, immune diseases, inflammation or blood disorders (laim 1; Page 262; 380pp; English.

This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. X04302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: X04311-X04410; amino acid sequences W78126-W78225) which are useful for preventing, treating or ambiliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; secreted protein; fusion protein; gene therapy; protein therapy; diagnosis; tissue; cancer; tumour; neurodegenerative disorder; leukaemia; developmental abnormality; foetal deficiency; blood; allergy; renal; ds; immune system; asthma; lymphocytic disease; brain; hepatic; lymphoma; inflammation; ischaemic shock; Alzheimer's disease; restenosis; AIDS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thymus, but not by the spleen. TARC is active against CCR4 expressing cells, e.g. T cells, peripheral lymphocytes and activated peripheral T cells, especially Hut 78, Hut 102, J MT2 and MT4 cells, and is useful as an immunomodulator or anti-inflammatory agent.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Individuals. It encodes T. Cruzi ubtiquitin (see W26534). 22 Isolated genomic DNA of cDNA molecules (769151-72) encode full-length antigens (see W26530-41), or epitope-containing repeat sequences (see W1994-102, W19979-86 and W26542-44) of native antigens, that can be used in a variety of immunoassays for detecting T. cruzi infection in a blood, serum, plasma, saliva, cerebrospinal fluid or urine sample. The polypeptides are also useful in vaccines and pharmaceutical compositions for inducing protective immunity against Chagas disease. The isolated DNA molecules can be used for recombinant molecules.
                                                                                                                                                                                                                                                                                                                                         WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing Trypanosoma cruzi infection by detecting antibodies to novel antigens - which are useful in vaccines to provide protectiv immunity against Chagas' disease claim 1; Page 50-51; 110pp; English.

       human protein. The gene number is given in the descriptor line. The gene human protein. The gene number is given in the descriptor line. The gene human immunoglobulin Fc portion (e.g. X20403) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 83 novel genes and their fragments (nucleic acid sequences: X20412-X20499; amino acid sequences Y00258-Y00377) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides.
                                                                                                                                                                                                                                                                          Zeng

                                                                                                                                       as probe radiolabeled DNA from the PCR derived plasmid psp65-Xaj-4 (see 072957). The plasmid of one of the positive clones - psK-XaI-11 (clone 11) contains a 684 bp insert (see 072956) essentially identical to the previously obtd. PCR derived sequences but contg. 78 additional bps at its 5' end. It encodes a prepeptide of 110 AAs (incl. the N-terminal Met) extending from Met 1 to Gly 110 (see R62619). AAs 1-25 constitute a leader sequence, and the mature protein comprises Tyr 26 to Gly 110. The sequence Tyr 2 - Gly 86 of clone 4 (072957) is equiv. to the sequence Tyr 26 - Gly 110 of clone 11 (072957) There are only two differences between clones 4 and 11. The polypeptide expressed by clone 11 is referred to as recombinant FXAI. A plasmid comprising the DNA designated accessors.

The specification describes secreted proteins and their corresponding polynucleotides which are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Pathological conditions can also be diagnosed by determining the amount of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The cDNA sequence encoding the Cor a I allergen of hazel was obtd. from the polyA+ mRNA isolated from ripe hazel pollen. The resulting cDNA was amplified by PCR using primers whose sequences were derived from the N-terminal amino-acid sequence of Cor a I. The DNA fragment produced was cloned into the pBluescript KS vector and transformed into E. coli XLI-Blue cells. The sequence allows mammals to be tested for allergic reactions to specific tree allergens. The derived polypeptide may be used to challange the mammal to elicit bronchial, conjunctival, dermal, nasal or oral provocation. The polypeptide may be used to treat a mammal afflicted with a pollen allergy. It is administered in an amount sufficient to hyposensitise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              20-FEB-1992.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Purified RNA polymerase II holo:enzyme - comprises RNA polymerase II and one or more regulatory proteins, pref. suppressor of RNA polymerase B proteins or SWI/SNF proteins

T polymerase B proteins or SWI/SNF proteins

C Laim II; Fig 17a; 154pp; English.

A cDNA clone (T59912) codes for the human homologue (W13829), hSRB7, of the yeast transcription regulatory factor ySRB7 (see also W13824). It was cloned and sequenced using 3 overlapping expressed sequence tags. hSRB7 is 35% identical to ySRB7, complements a ySRB7 deletion and, like its yeast counterpart, binds to the C-terminal domain of RNA polymerase II. It forms part of a holoenzyme complex that supports active transcription. SRB nucleic acids (see also T59904-11) and RNA polymerase II holoenzymes can be used to treat diseases resulting from alteration or deletion of the SRB gene, pref. by gene transfer technology. Probes based on the SRB gene, pref. by gene transfer technology. Probes based on Seguence 780 BP; 289 A; 145 C; 141 G; 205 T;

S-gene of a gametophytic self-incompatible plant - used to produce S-protein and for genetic manipulation to create self-incompatible cultivars
self-incompatible cultivars:
Example; Table 4, Page 20-21; 26pp; English.
Example; Table 4, Page 20-21; 26pp; English.
The difference at the 3' end between clones NA-2-2 and NA-2-1
(see N92416) is near full-length but during sub-cloning a short EcoRI fragment at the 5' end of the clone was inadvertently deleted. The inventors claim a method for it isolating and identifying a cDNA clone of an S-gene of a gametophytic self-incompatible plant (GSIP).
Sequence 794 BP; 309 A; 136 C; 140 G; 207 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (WHED ) W

                                                                                                                                                                                                                                                                                          New isolated human genes and the secreted polypeptides they encode processed in the secreted polypeptides they encode processed in the secreted polypeptides and disorders. For tumours, immune disorders, inflammation or haematological disorders processed in the secreted proteins. The polynucleotides and content or content or maniferating and content of their corresponding secreted polypeptides are useful for preventing, content of the medical conditions, e.g. by protein or gene content of the new polypeptides in a sample or by determining the presence of mutations in the new polypucteotides. Specific uses are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued for each polynucleotide, based on which tissues they are constitued developing products for the constituency disorders, antherosclerosis, constituency disorders, atherosclerosis, constituency disorders, atherosclerosis, consucretic consucretic disorders, selectal disorders, arthritic consucretic selection. The polypeptides are also useful for identifying their constituency diseases, AIDS and transplant considerations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
